NEPS TECHNICAL REPORT FOR ORTHOGRAPHY: SCALING RESULTS OF STARTING COHORT 3 IN GRADES 5 AND 7

NEPS Working Paper No. 49
Bamberg, December 2014

Working Papers of the German National Educational Panel Study (NEPS)

at the Leibniz Institute for Educational Trajectories (LIfBi) at the University of Bamberg

The NEPS Working Papers publish articles, expertises, and findings related to the German National Educational Panel Study (NEPS).

The NEPS Working Papers are edited by a board of researchers representing the wide range of disciplines covered by NEPS. The series started in 2011.

Papers appear in this series as work in progress and may also appear elsewhere. They often represent preliminary studies and are circulated to encourage discussion. Citation of such a paper should account for its provisional character.

Any opinions expressed in this series are those of the author(s) and not those of the NEPS Consortium.

The NEPS Working Papers are available at

<https://www.neps-data.de/projektübersicht/publikationen/nepsworkingpapers>

Blatt, I., Frahm, S., Jarsinski, S., & Prosch, A. (2014). *Technical Report for Orthography: Scaling results of Starting Cohort 3 in Grades 5 and 7* (NEPS Working Paper No. 49). Bamberg: Leibniz Institute for Educational Trajectories, National Educational Panel Study.

¹ This paper uses data from the National Educational Panel Study (NEPS): Starting Cohort 3 – 5th Grade, doi: 10.5157/NEPS:SC3:3.0.0. From 2008 to 2013, NEPS data were collected as part of the Framework Programme for the Promotion of Empirical Educational Research funded by the German Federal Ministry of Education and Research (BMBF). As of 2014, the NEPS survey is carried out by the Leibniz Institute for Educational Trajectories (LIfBi) at the University of Bamberg in cooperation with a nationwide network.

²Affiliation until December 31st, 2013, currently prospective teacher.

NEPS Technical Report for Orthography: Scaling Results of Starting Cohort 3 in Grades 5 and 7

Abstract

In the National Educational Panel Study (NEPS), the orthography competency is measured as a stage-specific supplement in secondary school from Grades 5 to 9. In this paper, the test and its theoretical framework are introduced, followed by a description of the data, of data analysis, and its results for the Scientific Use File in Grades 5 and 7. The Scientific Use File for Grade 5 is an upgrade. In the first release missing values were not coded separately because the software did not allow for this. This has now been revised in the third release, including items that are not totally identical. The aim of this Technical Report is to provide a description that will enable the scientific community to understand as well as use the data in an appropriate way. In so doing, the paper seeks to clarify in advance any potential questions that may arise concerning the data and to motivate data users to further analyze the data of the orthography competency in Grades 5 and 7.

Keywords

spelling competency, orthography

1. Introduction

Most competencies are measured coherently across the life span in the National Educational Panel Study (NEPS), that is, reading, mathematics, and domain-general cognitive functioning. These competencies are complemented by stage-specific measures that occur only in one specific stage. This is also true for the spelling competency, which is measured only in NEPS Stage 4—From Lower to Upper Secondary School.

The spelling test used in Stage 4 had been developed in previous works by Inge Blatt and Andreas Voss for Grades 4 and 5 (Voss et al., 2007; Blatt et al., 2007; Jarsinski, 2010; Frahm et al., 2011). In the National Educational Panel Study this test was then further developed during the course of the study with an identical framework but changed content. Like most competence tests, the scaling is also carried out by using models based on item response theory (IRT) in order to evaluate the quality of the test.

This paper presents the results of the analyses for the spelling competency in Starting Cohort 3—Grade 5 and Grade 7. First, the theoretical framework and its realization are briefly described. Thereafter, the analyses of its results are explained. The items and the results for Grade 5 differ slightly from the first release because missing data are coded separately in the third release. This is then followed by a discussion.

The present report is modeled on the technical reports by Pohl, Haberkorn, Hardt, & Wiegand (2012) and Haberkorn, Pohl, Hardt, & Wiegand (2012). We would like to thank Steffi Pohl and Kerstin Haberkorn for developing and providing standards for the technical reports and for giving feedback to previous drafts of this paper.

2. Testing Orthography Competence

The framework and test development for the orthography competence test have already been described in Blatt et al. (2011) and Frahm et al. (2011). Therefore, we will give only a brief outline of the framework and the tests used in the National Educational Panel Study for Grades 5 and 7.

The framework for all grades distinguishes between five subskills of orthography (phonographic syllabic subskill, morphological subskill, peripheral subskill, derivational subskill, and syntactic subskill). In order to measure these subskills, structural units of words (i.e., reality: #real #ity) are assigned to subskills, with each subskill consisting of 23 to 71 structural units in Grade 5 and 40 to 103 structural units in Grade 7. The subskills usually correlate highly, but previous works have proven a five-dimensional model to be most adequate for modeling the data. On top of this distinguished model, each word is also assessed at whole-word level, regardless of the subskills. Hence, the test offers an insight into two levels of orthography, depending on what kind of objectives are pursued for using the test data—either a differential score of spelling based on subskills or a generalized score based on the whole-word level.

Both tests consist of a cloze test and full sentences. In Grade 5 there are three full sentences and in Grade 7 there are nine full sentences. The tests include six pages and have to be mastered within 25 min. The test instructions and the test contents were played back from a CD that had been prerecorded with a professional speaker.

3. Data

3.1 The Design of the Study

For the main study in Grades 5 and 7, no split design was intended. This came as a result of the testing situation via CD. The entire test group took the test simultaneously.

For Grade 5 the test included 30 words in the cloze test and 44 words in the full sentences. In Grade 7 the test included 18 words in the cloze test and 119 words in the full sentences. Words that did not provide any information on orthography competency, such as “and”, were eliminated prior to the analyses. Therefore, the data set used for the analyses consisted of 54 full words in Grade 5 and 87 full words in Grade 7. Those 54 words in Grade 5 translate into 234 structural units, whereas those 87 full words in Grade 7 translate into 364 structural units. In both tests they are distributed across all subskills.

The test data were first transcribed by the IEA Data Processing Center (IEA DPC) using transcription conventions that had been established in the context of the PIRLS Study (cf. Frahm et al., 2011). The transcribed data were then entered into Microsoft Excel by the IEA Data Processing Center (IEA DPC) and coded by a newly developed tool (SRT-Editor) in Stage 4 (cf. Frahm et al., 2011). The data analyses described in this paper were performed by Stage 4 based on the scaling standards for NEPS (Pohl & Carstensen, 2012a). Deviations from these standards are indicated in the respective paragraphs of this paper.

3.2 Sample

The test was taken by 5,208 students in Grade 5 attending several different school types in Germany. In Grade 7 the test was taken by 6,196 students who also came from several school types. Students with special educational needs were not included.

4. Analyses

4.1 Missing Responses

In case of a missing item response, the item was coded as 95 = “missing gaps word”, 96 = “missing sentence word”, 97 = “cannot be read”, and 99 = “joke response”.

4.2 Scaling Model

For the data analyses, test data are first transcribed and then coded with special software developed for this test into dichotomous items (0 = wrong; 1 = right) with missings. Analyses are based on item response theory (IRT) with Rasch’s Simple Logistic Model (Rasch, 1960), and they are conducted via the program ConQuest (Wu, Adams, & Wilson, 1997). Ability estimates for spelling competency were estimated as weighted maximum likelihood estimates (WLEs, Warm, 1989). Person parameter estimation in NEPS has already been described in Pohl & Carstensen (2012a), whereas the data available in the SUF are described here in Section 7.

4.3 Reviewing the Quality of the Test

The spelling test was specifically constructed to be implemented in NEPS. In order to ensure appropriate psychometric properties, the quality of the test was reviewed. It is important to

note that, prior to the analyses, words such as “and” that were correctly solved by a huge majority of the sample and also constants were directly removed. During the estimation of student ability and item difficulty, some misfit items had to be removed, because they deviated from the PISA reference by a maximum item fit (weighted mean square (MNSQ)) of 1.2 and a discrimination of less than 0.26 (OECD, 2005). For Grade 5 these were 4 out of 54 items at whole-word level and 53 out of 234 items at structural-unit level; in Grade 7 these were 9 out of 87 items at whole-word level and 63 out of 364 items at structural-unit level.

5. Results

5.1 Parameter Estimates

5.1.1 Item parameter and person parameters

The estimated item parameter and person parameters are represented in the form of item fit, item difficulty, and student ability. The collection of item parameters is provided in the Appendix (see Tables 3, 4, 5, and 6).

At whole-word level and structural-unit level, item fit has removed misfit items not over 1.20. In terms of item difficulty, it can be seen that both tests still offer easy as well as difficult items. For Grade 5 they are within the range of -5 and 3 for the whole-word level (see Figure 1) and within the range of -4 and 3 for the structural-unit level (see Figure 2). For Grade 7 they are within the range of -4 and 2 for the whole-word level (see Figure 3) and within the range of -4 and 3 for the structural-unit level (see Figure 4). Compared with the whole word, the structural units are, in total, a little bit easier. Students solve more structural-unit items correctly than whole-word items. All in all, student ability is high overall.

Map of Item Difficulty and Student Ability

Figure 1. Whole-word level in Grade 5.

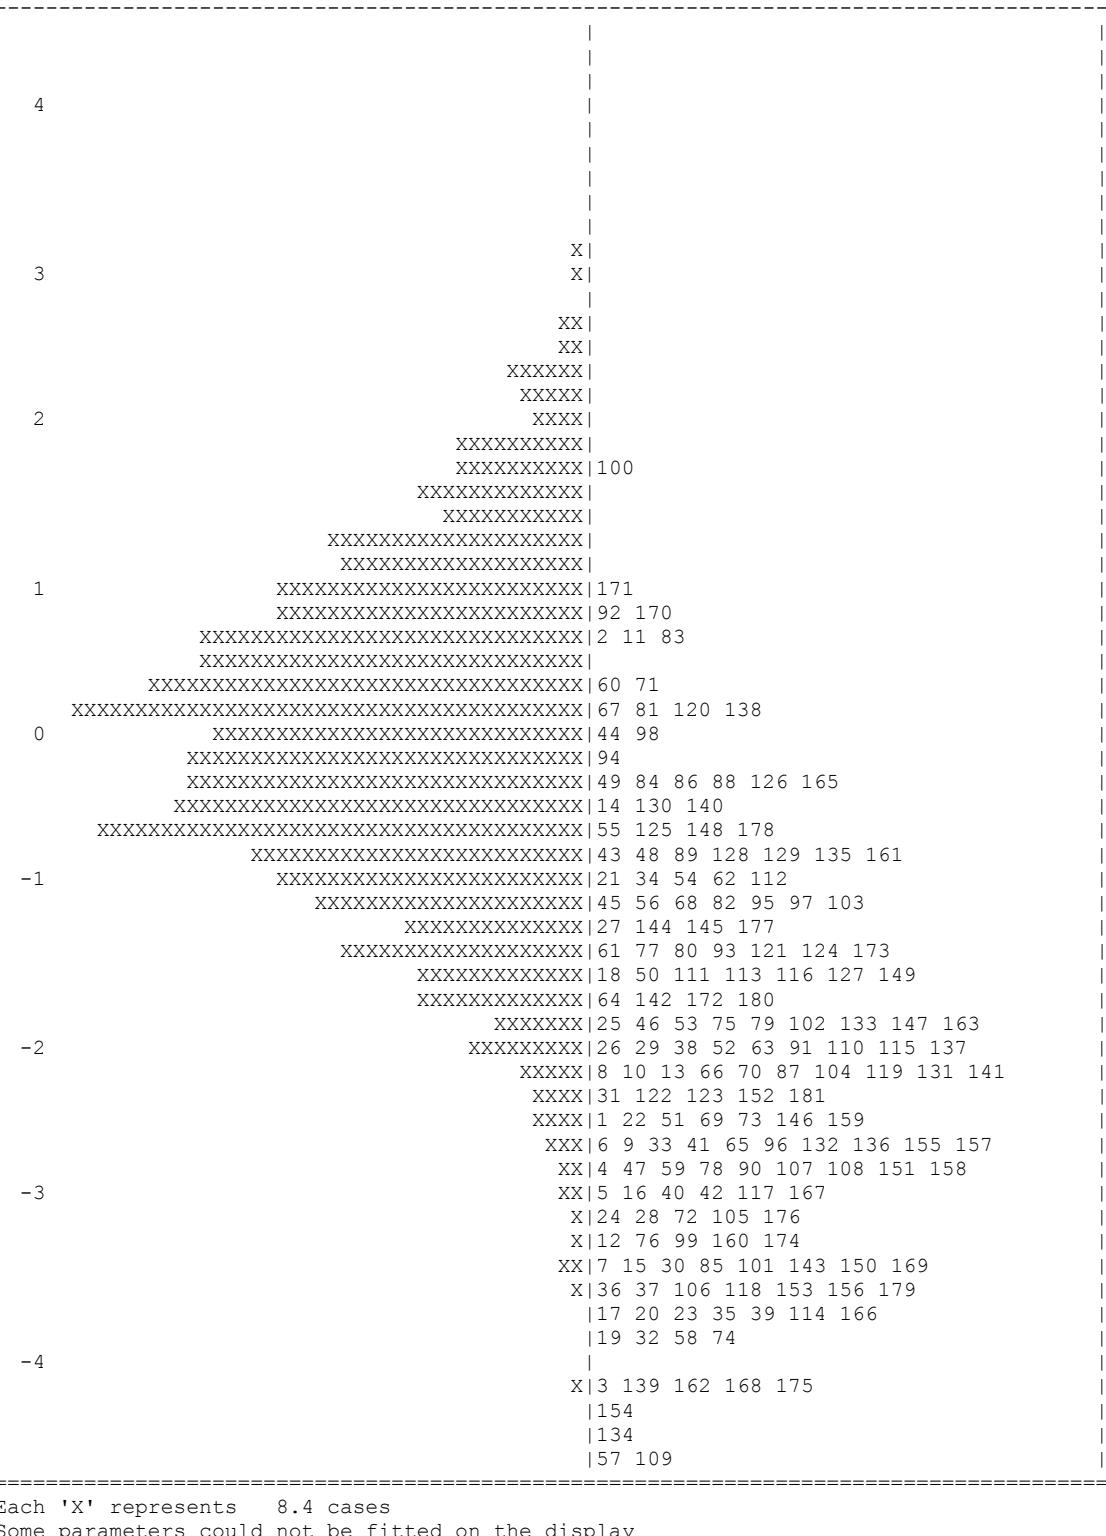

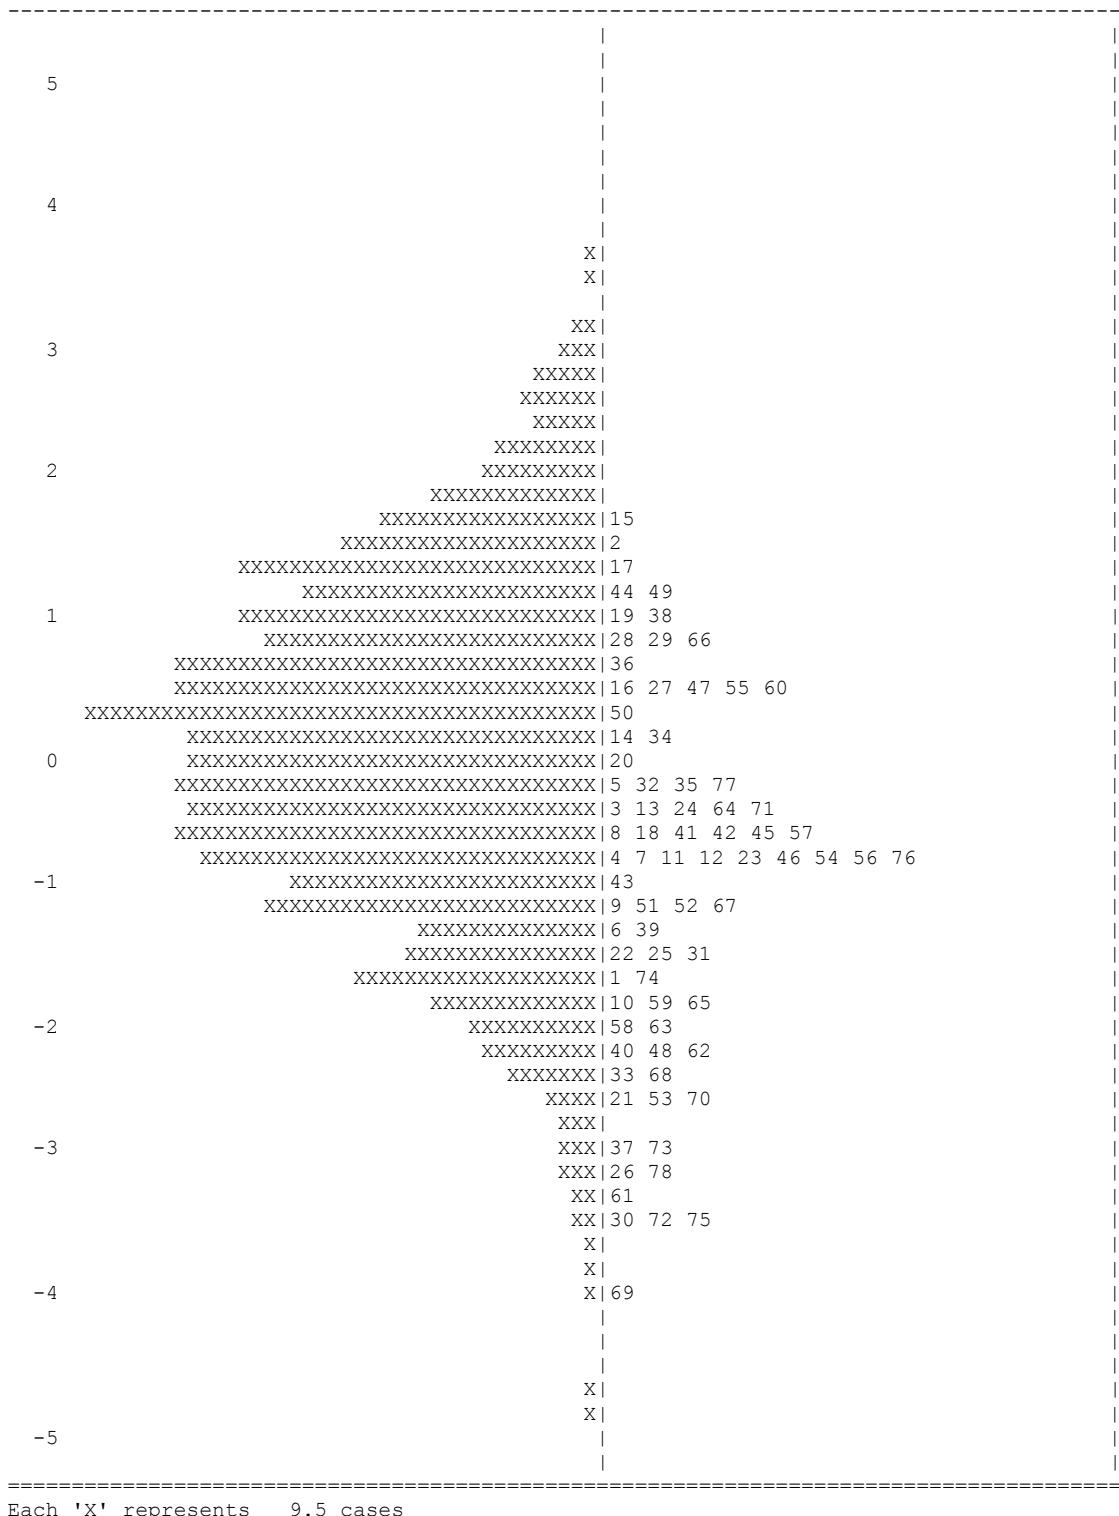

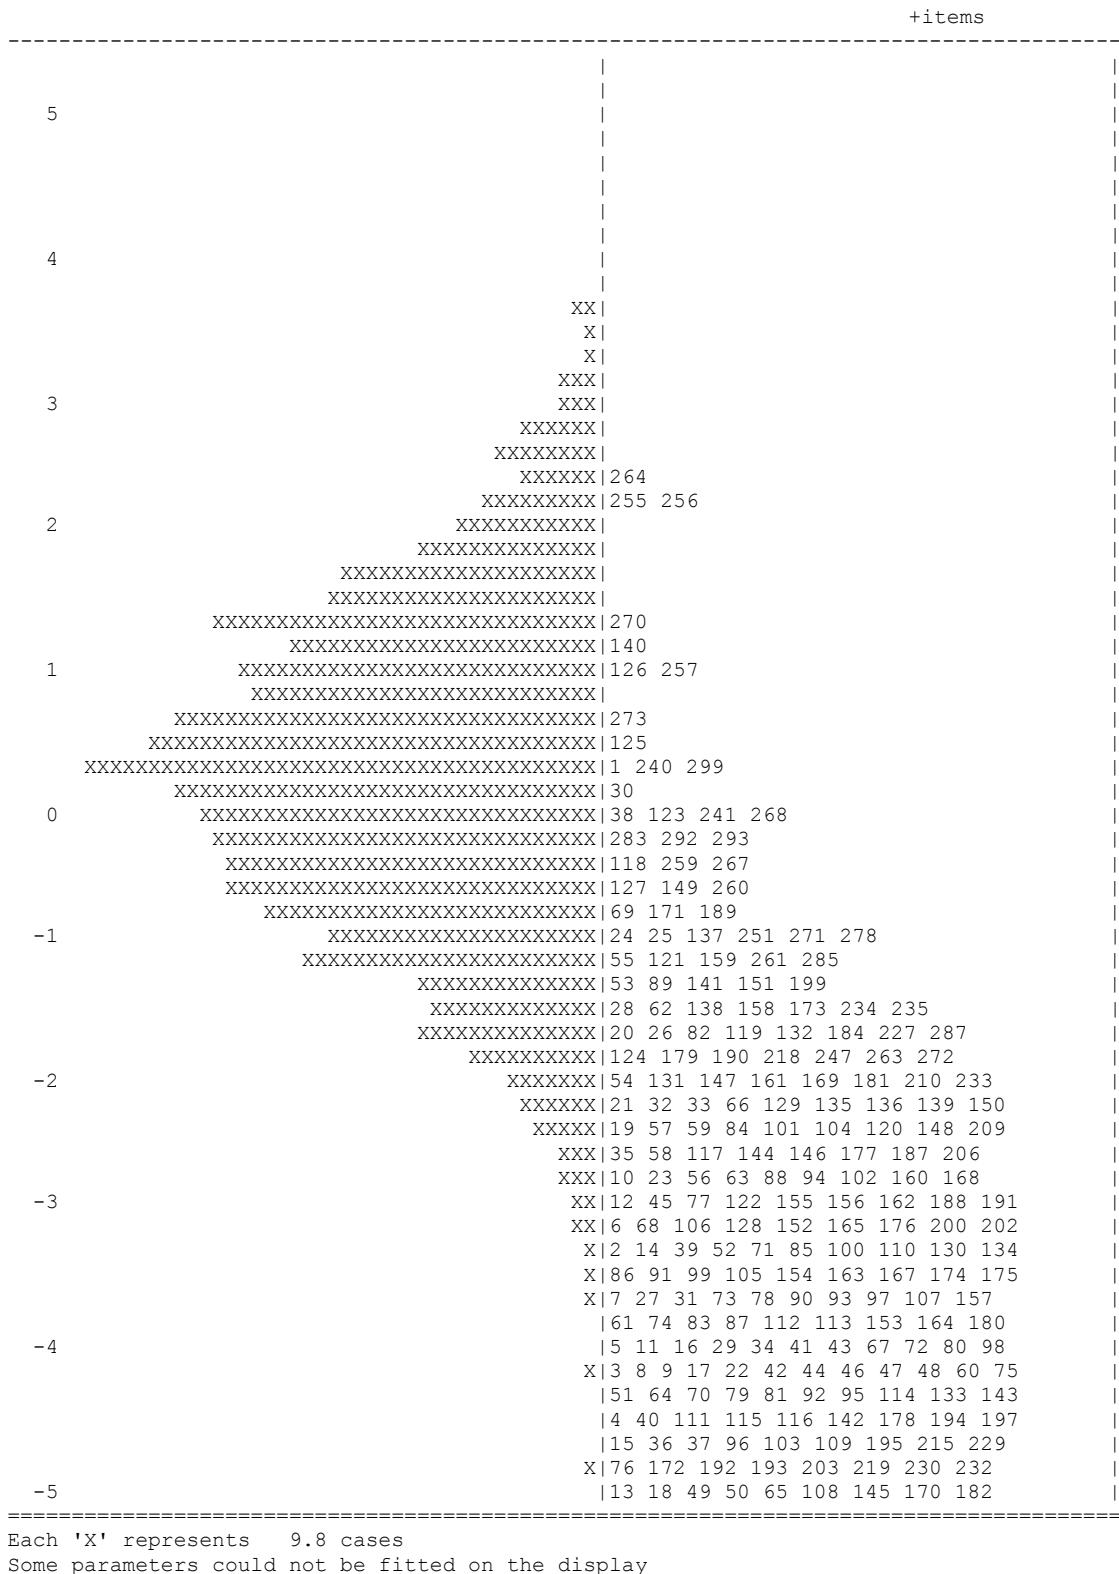

Figure 2. Structural-unit level in Grade 5.

*Figure 3. Whole-word level in Grade 7.*

Tables 1 and 2 show the results of the descriptive statistics.

Table 1

Descriptive Statistics Grade 5

	N	Minimum	Maximum	Mean	Standard deviation	Variance
org5_sc1a	5208	-5.69	4.45	-0.01	1.38	1.89
org5_sc2a	5208	0.34	1.51	0.38	0.08	0.06
org5_sc1b	5208	-8.69	4.74	-0.10	1.19	1.42
org5_sc2b	5208	0.17	1.44	0.24	0.08	0.07

For Grade 5 the variables org5_sc1a and org5_sc1b are the raw (nonstandardized) estimated student ability with the standard error in terms of org5_sc2a and org5_sc2b at the whole-word and structural-unit level. It can be transformed according to the needs of the researcher.

Table 2

Descriptive Statistics Grade 7

	N	Minimum	Maximum	Mean	Standard deviation	Variance
org7_sc1a	6196	-6.90	4.90	0.01	1.37	1.89
org7_sc2a	6196	0.26	1.45	0.31	0.09	0.01
org7_sc1b	6196	-9,03	5,09	0.18	1.37	1.88
org7_sc2b	6196	0.14	1.47	0.26	0.12	0.01

For Grade 7 the variables org7_sc1a and org7_sc1b are the raw (nonstandardized) estimated student ability with the standard error in terms of org7_sc2a and org7_sc2b at the whole-word and structural-unit level. It can be transformed according to the needs of the researcher.

5.2 Reliability

For Grade 5 the reliability (EAP/PV) at the whole-word level is 0.963 and 0.928 at structural-unit level. In terms of its high value, one can assume that the test is reliable.

For Grade 7 the reliability (EAP/PV) at the whole-word level is 0.942 and 0.945 at structural-unit level. In terms of its high value, one can assume that the test is reliable.

6. Discussion

The test has proven to be reliable after item elimination in accordance with statistical criteria. Furthermore, the test is objective because dictation is given from a CD recording and executed by experienced test administrators. However, those statistical processes are not the only steps necessary for developing a reliable test. It must be stressed that prior theoretical work and the development of a common framework are important prerequisites for successful testing. Prior development processes include a thorough interdisciplinary research of linguistics, didactics, and empirical studies.

In order to give further insight into the meaning of the results, it is important to underline the difference of both levels, particularly in terms of item difficulty. At the whole-word level, the difficulty has proven to be statistically adequate. At the structural-unit level, however, a majority of rather easy items has become evident. This is intended as the structural units provide some important additional information on the students' strengths and weaknesses, which allows for a more differentiated insight into their spelling competency. By offering a score on both levels, that is, a general score and a differential one, we are facilitating a variety of options for using the test data according to individual research objectives.

7. Data in the Scientific Use File

There are 231 items in the data set of Grade five and 379 items in the data set of Grade 7 that are either scored as dichotomous variables with 0 indicating an incorrect response, 1 indicating a correct response and 95, 96, 97, and 99 indicating missing values. Manifest scale scores are provided in the form of WLE estimates (Grade 5: org5_sc1; Grade 7: org7_sc1) including the corresponding standard error (Grade 5: org5_sc2; Grade 7: org7_sc2). The ConQuest Syntax for estimating the WLE scores from the items is provided in Appendix.

Plausible values that allow for an investigation of latent relationships of competence scores with other variables will be provided in later data releases. Alternatively, users interested in investigating latent relationships may either include the measurement model in their analyses or estimate plausible values themselves. A description of these approaches can be found in Pohl and Carstensen (2012a).

Item Parameters and Item Fit

Tables 3 and 4 represent the estimated item parameters for each item on the whole-word level and the structural-unit level for Grade 5. Tables 5 and 6 represent the estimated item parameters for each item on the whole-word level and the structural-unit level for Grade 7. In the first two columns item numbers and item names are displayed. Columns 3 and 4 represent the item difficulty by showing the mean and the standard error. The weighted fit is represented by the weighted mean square (MNSQ) and the *t*-value. Finally, there is the discrimination of the items.
